

From rain to spring: water from the ground
Demonstrating how water flows through the ground - and how it can be used and polluted

From Mary, New Mexico

I modified my stream table to do this activity. In the future I think I will use the cardboard box with plastic in the 'River in a gutter' activity. I would like to layer the media with a porous sand and then an impermeable layer so there is less water showing on the surface and it flows to 'springs' further from the source.

('Mighty river in a small gutter' Earthlearningidea can be found in the Earth Energy category)
