

## Party-time for volcanoes Take a 'chance' on the volcano erupting

**From David, British Geological Survey**

The following graph shows the results of many exploding party poppers.

The weights referred to on the x axis are 100gms so, as we have reported before, 3500gms is the greatest weight so far.

The results below are from November 2012; an interesting comparison. Party poppers are about as predictable as earthquakes or volcanic eruptions!
