

What happened when?: sorting out sequences using stratigraphical concepts Are the age-based stratigraphical concepts principles or laws? – and how do you use them?

Principle or law?

Ask your pupils to complete the table below by writing if they think each sedimentary sequence statement is a 'Principle' or a 'Law'.

If they think the statement is a 'Principle' they should add any exceptions to the rule. (*Some answers are given in the 'Context' section of this Earthlearningidea*).

Sedimentary sequence	Principle or law?	
	Principle	Law
Superposition of strata – states that: 'the layer on top is the youngest.'		
Cross-cutting relationships – states that: 'anything that cuts across anything else must be younger.'		
Included fragments - states that: 'anything included in anything else must be older.'		

Applying the principles

Now ask your pupils to apply the principles to work out the age relationships in:

- a patched piece of road or pavement;

- outdoor (or indoor) courts (e.g. tennis or badminton courts) with several lines;

- a cracked wall;

- a local rock exposure;
- a geological map.

The back up

Title: What happened when?: sorting out sequences using stratigraphical concepts

Subtitle: Are the age-based stratigraphical concepts principles or laws? – and how do you use them?

Topic: Understanding and applying stratigraphical concepts, indoors and outdoors.

Age range of pupils: 11 years upwards

Time needed to complete activity: 15 minutes

Pupil learning outcomes: Pupils can:

- determine whether the stratigraphical concepts used for age sequencing are principles (usually apply) or laws (always apply);
- apply the concepts in a range of indoor and outdoor situations, natural and produced by humans.

Context:

The stratigraphical concepts used for age sequencing can be applied through indoor and outdoor exercises in both natural and constructed situations.

- **‘Superposition of strata’** is the **‘Principle of Superposition of Strata’**; exceptions include:
 - overfolding, when rock sequences are turned upside down (inverted);
 - thrusting, when older rocks are forced up and on top of younger ones by large-scale thrust faults;
 - glaciation, when glaciers and ice sheets can sometimes drop glacial erratics of older rocks on top of younger ones.

These different possibilities can be modelled using your hands through the *‘Modelling by hand’* *‘when the youngest rock is not on top’* Earthlearningidea.

- **‘Cross-cutting relationships’** is the **‘Law of cross-cutting relationships’** – and always applies.
- **‘Included fragments’** is the **‘Law of included fragments’** and always applies.

But in both ‘Cross-cutting relationships’ and ‘Included fragments’, you must make careful observations to be sure that the relationships are indeed cross-cutting, and the fragments definitely are included.

The concepts are illustrated in these examples.

What is the tarmac sequence in the patched road below?

Patched road outside a farm house – which tarmac was laid first?

In the cracked wall photo, which came first, the cement blocks (included fragments), the blocks at the bottom or the top (superposition of strata) or the crack (cross-cutting relationships)?

For the indoor court photo, use the law of cross-cutting relationships to work out which tape was laid first, the yellow, the black or the grey?

A wall damaged by monsoon weather in the Gambia.

Following up the activity:

Try the *‘Laying down the principles’* Earthlearningidea to extend the teaching to include more stratigraphical concepts. Then apply them further in the *‘Where shall we drill for oil?’* Earthlearningidea.

Underlying principles:

- These concepts are the fundamental methods used by geoscientists to sequence rocks and rock events.

Thinking skill development:

- The concepts are patterns applied to sequences (construction).
- How the concepts should (and should not) be applied causes cognitive conflict.
- Discussion of the application of the concepts involves metacognition.
- The concepts can be applied (bridged) to a range of other contexts including archaeological and forensic ones.

Resource list:

- suitable outdoor and indoor situations
